

skinfit® Klima

ultimate comfort and
functionality for your skin

Our collection of sports underwear is knitted with the functional microfibre "Isofil" fiber. This fiber absorbs moisture from the body and quickly distributes it over a large surface area (with a short-sleeve shirt, for example, over 32 square meters). Thus, the perspiration evaporates quickly or is transferred to the next clothing layer. The result: in spite of exertion, you feel dry. In the cold, on the other hand, skinfit® Klima has a warming effect due to the large amount of air captured in the fiber. The effect is similar to that of thermostatic control: When you are overheating, skinfit® Klima helps your body stay cool. In cold temperatures the garments provide protection with their extraordinary insulating properties.

- Moisture wicking and evaporation
- Breathable
- Superior insulation (for optimum microclimate)
- Easy care
- Quick -drying
- Odor-resistant
- Flat seams

The difference between Klima and Klima.soft

Klima – is a very technical material which is designed for highest functionality; therefore, especially recommended for intensive sports activities or cold temperatures. The quick drying time and the level of comfort when worn during sports will inspire you.

Klima.soft – is appealing thanks to the soft, comfortable feeling it provides when worn and is also extremely popular as everyday wear. Temperature-regulating hollow fibres provide an ideal microclimate.
